- When mixing rations, put all grains, additional roughages, oils & molasses into mixer first and mix thoroughly prior to adding Grand 4-T-Fyer® or other pellets. This reduces the amount of pellet breakdown and “fines,” which is the main cause of customer complaints & intake problems associated with the use of this product.
- Keep corn level around or below 50% – this will help reduce hair burn & fluctuations in intakes.
- Adding roughages (i.e. cottonseed hulls, beet pulp, Precon®, etc.) to grower/ breeder diets allows for control of fat depositing and will help in giving the appearance of more rib depth & volume.
- Adjust molasses levels to accommodate mixer/feeder capabilities.
- The use of Deccox®, Rumensin®, or Bovatec® are recommended for coccidiosis control, but optional.
- Barley use is optional, and has shown to give a smoother, firmer finish. Adding to mix toward the end of the feeding period is recommended but optional to achieve this desired look and feel.
- Feeding a minimum of 1-2 flakes of grass mix hay is beneficial to support digestion and maintain rumen function. We recommend free-choice hay at all times for heifer development
- Always provide plenty of fresh, clean water at all times.
- Consistency is essential! Feed at regular times each day. Monitor intakes and watch for irregularities. If a ration change is needed, make sure to do it gradually over a period of 10-14 days.
